## **1.0 EXECUTIVE SUMMARY**

A report published by the United States Environmental Protection Agency (US EPA) has established total maximum daily loads (TMDL) for municipalities with a municipal separate stormwater system (MS4) discharge permit within the Christina River Basin in Pennsylvania, Delaware, and Maryland.

West Goshen Township is assigned pollutant reduction goal of 60.87% for sediment. Based on this proposed MS4 TMDL Strategy, the sediment loading is anticipated to be reduced by approximately 61% with the implementation of effective best management practices (BMPs), namely detention basin retrofits, stream bank stabilization, riparian buffer restoration, bioswale installation, and street sweeping. Iterative implementation of the proposed BMPs is set to begin upon approval and continue through the next four permit cycles.

I hereby certify that, to the best of my knowledge, the stormwater management best management practices described herein are designed in conformance with the conditions of the *Notice of Intent for Coverage Under NPDES General Permit for Stormwater Discharges (PAG-13) from Small Municipal Separate Storm Sewer Systems (MS4s)* and the *Pennsylvania Stormwater Best Management Practices Manual* (Document No. 363-0300-002), as amended.

Matthew S. Bonanno, PE073374

## 2.0 INTRODUCTION

The following Total Maximum Daily Load (TMDL) Strategy addresses how the Township of West Goshen intends to meet the pollutant reduction requirements listed in the TMDL report dated September, 2006 entitled, “Total Maximum Daily Loads for Bacteria and Sediment in the Christina River Basin, Pennsylvania, Delaware, and Maryland” as established by the United States Environmental Protection Agency, Region III.

Located in eastern Chester County, Pennsylvania; West Goshen Township is an MS4 community (PAI 130532) currently in its second permit term. The entire township is classified as an Urbanized Area (UA) according to the United States Census Bureau’s 2000 census. The western portion of the township lies within the Brandywine Creek Watershed and the central and eastern portions comprise part of the Chester Creek Watershed. The above mentioned Brandywine Creek Watershed is a sub-watershed of the Christina River Basin, encompassing approximately 2,362 acres in the western region of West Goshen Township. Many of the stream segments within the Brandywine Creek Watershed have been classified by the Pennsylvania Department of Environmental Protection as impaired, including those located within West Goshen Township. The EPA’s Christina River Basin TMDL Report establishes a sediment TMDL for the Brandywine Creek Watershed and provides a sediment Waste Load Allocation (WLA) to each of the MS4s in the watershed. The table below lists West Goshen’s current and allocated sediment loads, as well as the reduction requirement as described by the Christina River Basin TMDL Report. The EPA established these values using their Hydrologic Simulation Program – FORTTRAN (HSPF).

## 3.0 BRANDYWINE CREEK WATERSHED TMDL STRATEGY

The following strategy provides the information requested in the Authorization Form – Part C, items a, b, and c, as applies to the content of a complete TMDL Strategy. Tables 1, 2, 3, and 4 provide information in tabular form as requested in the guidance document.

**vi. Determination of Baseline Load**

Baseline sediment loading for the Brandywine Creek Watershed was determined using the MapShed modeling software. MapShed is a “GIS-based watershed modeling tool that uses hydrology, land cover, soils, topography, weather, pollutant discharges, and other critical environmental data to model sediment and nutrient transport within a watershed.”<sup>1</sup> All GIS data used to create the Brandywine Creek Watershed sediment baseline loading model was sourced from the MapShed Download web site.<sup>2</sup> The baseline model was created using existing land use data without the addition of proposed

control measures or BMPs. Only Brandywine Creek Watershed sub-basins B14 and B15 were included in the Mapshed model, as sub-basin B29 was not included in MS4 waste load allocations table (Table 4-7) of the Christina River Basin TMDL Report. A sediment adjustment factor of 0.4 was used to calibrate the model and bring baseline sediment loads to a level consistent with those reported in the Christina River Basin TMDL Report. Existing detention basins located within the Township limits of the Brandywine Creek Watershed were added to the baseline model at an assumed average depth of three feet. This was done to provide a model that represented the current hydrologic conditions of West Goshen Township. A list of all detentions basins included in the baseline Mapshed model can be found in Appendix B. Using MapShed's Urbanized Area Viewer, the baseline sediment load for West Goshen Township was determined to be 470 tons per year. This is an increase of approximately nine tons per year from the baseline sediment load listed in the Christina River Basin TMDL Report. See Appendix C for all MapShed modeling results.

#### **vii. Pollutant Load Reduction Required & Reduction Strategy**

West Goshen Township has developed a strategy to achieve their required reduction of 60.87% of the current sediment load being discharged to the Brandywine Creek Watershed through the implementation of stormwater detention basin retrofits, streambank stabilization, riparian buffer restoration, street sweeping, and bioswales. The introduction of these Best Management Practices (BMPs) to the Township's portion of the Brandywine Creek Watershed and provide water quality benefits to surface runoff prior to it reaching receiving waters; and in the case of detention basin retrofits, reduce the volume of stormwater being discharged to the stream. The Township Engineer and staff collaborated with and their engineering consultant Herbert, Rowland & Grubic, Inc. (HRG) on the selection of the types of BMPs to utilize for compliance. Their respective locations came as a result of a feasibility investigation performed in the Spring of 2015. The investigation led to the conclusion that retrofitting existing detention basins to allow for infiltration and/or bioretention offered the most promising and cost effective means of achieving the required sediment load reduction. The Township and HRG identified candidate basins that offered the greatest potential for runoff reduction in locations in which the Township felt property owners would likely be cooperative. Once all of the candidate basins were identified, modeling was conducted by HRG using Pennsylvania State University's GWLF-E-based MapShed watershed modeling software (version 1.3.0) to determine the pollutant reductions each basin retrofit could yield.

The Township also expressed interest in the installation of bioswales in two large, existing residential developments. The existing swales in the developments were either filled in or replaced with pipe, causing runoff to enter the MS4 much faster than originally intended. The bioswales would help reduce volume and rate of runoff entering the MS4, as well as provide additional water quality through bioretention and infiltration. The bioswales were added to the model and sediments reductions were recorded.

A street sweeping program was also included in the MapShed model. The Township proposes conducting township-wide street sweeping once per month during the months of April through October to provide further sediment reduction. This was deemed as a practical control measure since the Township has no current street sweeping program, residents have desired the service, and

sweeping would also help achieve the Township’s required total phosphorus load reduction mandated by the Goose Creek Watershed TMDL Report.

The results of the modeling revealed a need for further reduction of sediment to achieve the 60.87% reduction requirement (Table 5). The options of streambank restoration, stream calming, and riparian buffer restoration were investigated and determined by the Township and HRG to be a viable means to generate a greater sediment reduction, as well as a way to reduce nutrient loads through plant uptake. The Township first identified sections of stream along municipally owned properties that would allow for access to the streambank and buffer areas without requiring the procurement of easements from Township residents. The addition of the streambank and riparian buffer BMPs to the MapShed model resulted in the Township meeting its reduction requirement, as shown in Table 10.

Table 5: West Goshen MS4 Baseline Sediment Load & Proposed Sediment Load Reduction

<b>MS4 Permittee</b>	<b>Baseline Sediment Load (ton/year)</b>	<b>Reduction Requirement</b>	<b>Target Sediment Load (ton/year)</b>
West Goshen Twp.	470	60.87%	184

#### **viii. Proposed BMPs and Control Measures**

The sediment reductions achieved through the implementation of the proposed BMPs described herein were determined through the use of the same MapShed model used to determine the Township’s current sediment loads. Each of the proposed BMPs, their locations, implementation schedule, functionality, proposed pollutant reductions, and maintenance requirements are listed below.

##### **Streambank Stabilization, Stream Calming, and Buffer Restoration BMPs**

Streambank stabilization prevents further erosion and degradation of disturbed or cut back streambanks ultimately resulting in lower sediment and nutrient loads being released into the stream. Where practical, the Township will implement vegetative streambank stabilization to promote plant uptake of nutrient laden runoff in order to reduce the amount of nutrients eventually reaching the impaired waterways. Vegetative stabilization relies on the root structures of established plantings to stabilize the streambank and provide scour protection. This method offers a relatively inexpensive means of stabilization and provides a naturalized appearance to the rehabilitated streambank.

Stream calming will be achieved through the use of rock vanes, wing deflectors, and linear deflectors where practical in combination with streambank stabilization and riparian buffer projects. These instream structures will direct stream flow away from eroding or newly stabilized streambanks, as well as create stream meanders that will reduce stream velocity, further preventing streambank erosion and scour. The structures will be constructed of natural materials such as rock, root wads, and logs. The exact number and locations for the proposed instream structures will be determined upon approval of the TMDL Strategy during the completion of the Design Details.

West Goshen Township intends to perform riparian buffer restoration on the segments of stream to be stabilized. The goal of the riparian buffer projects is to naturalize the existing floodplain and reestablish buffer areas along the stream segments to a minimum width of 50 feet. The restorations will include the removal and replacement of dead and diseased vegetation; as well as new plantings in areas where buffers have diminished in size. The riparian buffer restoration project will be implemented concurrently with the stabilization projects in order to maximize the nutrient load reduction potential of each segment of stream to be enhanced. The locations of the proposed streambank stabilization and riparian buffer restoration projects are displayed on the location map in Appendix D. A summary of reductions achieved on a per project basis are provided in Table 6.

Location ID	Stream Name	Length of Stream Segment		Implementation Permit Term	Reduction Achieved
SS 4	Taylor Run	1,600 m	5,249 ft	3	13%
SS 5	UNT to Taylor Run	600 m	1,969 ft	3	7%
SS 6	UNT to Taylor Run	1,500 m	4,921 ft	4	9%
SS 7	UNT to Taylor Run	1,600 m	5,249 ft	5	10%
SS 8	UNT to Plum Run	1,200 m	3,937 ft	5	5%

Operation and maintenance requirements for the streambank stabilization and buffer restoration projects shall include:

- Regular watering of plantings during first growing season. Planting in the fall may reduce the need for additional watering.
- Conduct monthly site visits to ensure plantings are healthy and well watered, weeds are properly managed, sufficient mulch is in place until site is stabilized and planting have become established.
- Conduct annual inspections once streambank is stabilized and plants have become established.
- Immediately upon notice; repair any rills, gullies, or streambank cutting that may occur.
- Remove weeds and invasive plant species during each growing season. Naturally growing native vegetation should be left intact to promoted stabilization of the streambank and surrounding area.
- Replace mulch as needed
- Remove accumulated trash and debris as noticed.
- Remove and replace dead and diseased plantings.
- Keep machinery and vehicles away from stabilized areas.

### Street Sweeping Program

Street sweeping reduces the amount of sediment, nutrients, trash, and debris often found in stormwater by removing these potential contaminants from the road surface prior to it being swept up by stormwater runoff and carried through the storm sewer, eventually to the receiving waters (Table 7). West Goshen Township intends to conduct street sweeping once per month during the months of April through October.

Operation and maintenance requirements for the street sweeping control measure shall include:

- Develop and adhere to a regimented sweeping program that includes maps of sweeping areas, sweeping schedules, and maintenance schedules.
- Maintain sweeping equipment in good working order.
- Maintain a sweeping log to include: daily sweeping locations, operator’s name, weight and volume of sweepings, and means of disposal.
- Dispose of sweepings in a manner deemed satisfactory by PADEP

Location ID	Frequency Of Sweeping	Months Per Year	Implementation Permit Term	Reduction Achieved
Township	Monthly	7	2	3%

### Detention Basin Retrofit

Detention basins are relatively simple basins designed to receive, temporarily hold, and discharge stormwater at a controlled rate. While they can provide rate and volume control, detention basins offer limited water quality benefit. Detention basin retrofits transform these simple catch, store, and release ponds into BMPs that provide infiltration, bioretention, and improved sediment and nutrient removal capabilities. This is achieved by extending the storage time, improving soil conditions to allow for greater infiltration rates, and naturalizing the basins with native and/or wetland plant species.

West Goshen Township conducted a detention basin retrofit on a large basin in 2010. The basin, known as the Bicking Basin, serves as the main stormwater management facility for a large residential development in the southeast corner of the Township. Finding that the retrofitted basin produced substantial water quality and aesthetic value, the Township expressed interest in conducting more retrofits in order to achieve the sediment reduction requirements mandated by the Christina River Basin TMDL.

The Township is proposing to perform four additional detention basin retrofits at locations within the Township limits of the Brandywine Creek watershed (Table 8). While the extent and nature of the retrofits will rely on the results of future engineering investigations, each basin retrofit will reduce the quantity and increase the quality of the stormwater runoff reaching the impaired streams. For modeling purposes, the fraction of area treated values for each retrofit were taken as a percentage of

the basin’s respective sub-basin. The locations of the proposed detention basin retrofit projects are displayed on the location map in Appendix E.

Table 8: Proposed Detention Basin Retrofit BMPs Summary

<b>Basin Location ID</b>	<b>Street Location</b>	<b>Implementation Permit Term</b>	<b>Reduction Achieved</b>
RF 4	Farren Lane	2	2%
RF 5	Hamilton Drive	2	2%
RF 6	Goshen Road	3	2%
RF 7	Garlington Circle	4	3%

Operation and maintenance requirements for the detention basin retrofit projects shall include:

- Conduct regular inspections until site is stabilized and plantings are established.
- Immediately upon notice, repair and erosion issues in the basin.
- Remove and replace dead or diseased plantings.
- Remove weeds and invasive species from the basin.
- Remove accumulated sediment and debris.
- Mulch as necessary.
- Use no chemical herbicides or pesticides.
- Maintain a “No Mow Zone” around the perimeter of the basin.

**Bioswales**

Much like bioretention basins, bioswales decrease the quantity of stormwater runoff entering the storm sewer system, while increasing stormwater quality. Bioswales are an alternative to concrete channels or storm sewer piping that provide conveyance of stormwater, while allowing for infiltration and plant uptake to help reduce pollutant loads.

The Township proposes to install a bioswale (BS1) at a location that is currently comprised of a concrete, low flow channel and small elongated basin (Table 9). Additionally, the Township has identified the North Hills residential development as a target for large scale bioswale installation project (BS2). The residential development originally relied on vegetated swales for stormwater conveyance. The majority of the swales have been filled in, or replaced with storm pipe. The Township wants to reestablish and improve upon the original vegetated swales by installing bioswales in their place.

Table 9: Proposed Bioswale BMPs Summary			
<b>Basin Location ID</b>	<b>Street Location</b>	<b>Implementation Permit Term</b>	<b>Reduction Achieved</b>
BS 1	East Marshall Street	2	1%
BS 2	North Hills Development	3	4%

Operation and maintenance requirements for the bioswale installation projects shall include:

- Conduct regular inspections until site is stabilized and plantings are established.
- Immediately upon notice, repair and erosion issues in the basin.
- Remove and replace dead or diseased plantings.
- Remove weeds and invasive species from the basin.
- Remove accumulated sediment and debris.
- Mulch as necessary.
- Use no chemical herbicides or pesticides.
- Maintain a “No Mow Zone” around the perimeter of the basin.

**ix. BMP Modeling Results**

As shown in Table 10 below, the combination of BMPs West Goshen Township has installed and proposes to implement will achieve a reduction in sediment of 61% of the current baseline load. Detailed modeling results can be found in Appendix B.

Table 10: Summary of MapShed Modeling Results			
<b>Current Sediment Load w/out BMPs (ton/year)</b>	<b>Proposed Sediment Load w/ BMPs (ton/year)</b>	<b>Reduction Achieved (%)</b>	<b>Reduction Required (%)</b>
470	184	61	60.87

## **x. Implementation Schedule**

### Permit Term 2 (current term)

- Create MS4 TMDL Design Detail.
- Explore funding opportunities.
- Consider establishing a stormwater authority.
- Explore street sweeping options.
- Implement street sweeping program.
- Document all street sweeping activities
- Maintain records of all MS4 / TMDL related activities.
- Encourage land owner participation in stream improvement projects.
- Conduct Farren Lane Basin Retrofit (RF 4)
- Conduct Hamilton Drive Basin Retrofit (RF 5)
- Install East Marshall Street Bioswale (BS 1)
- Conduct annual inspections of installed BMPs included in TMDL Plan.

### Permit Term 3 (2017 – 2022)

- Conduct Goshen Basin Retrofit (RF 6)
- Conduct North Hills Bioswale construction project (BS 2)
- Conduct Stream Enhancement Project on Stream Segment Four (SS 4)
- Conduct Stream Enhancement Project on Stream Segment Five (SS 5)
- Conduct annual TMDL Plan evaluations. Adjust plan to meet goal as necessary.
- Update TMDL records no less than annually.
- Reevaluate sweeping program and increase frequency if beneficial.
- Continue to seek public involvement in MS4 / TMDL related projects.
- Continue to explore funding opportunities.
- Conduct annual inspections of installed BMPs included in TMDL Plan.

### Permit Term 4 (2022-2027)

- Conduct Garlington Circle Basin Retrofit (RF 7)
- Conduct Stream Enhancement Project on Stream Segment Six (SS 6)
- Conduct annual TMDL Plan evaluations. Adjust plan to meet goal as necessary.
- Update TMDL records no less than annually.
- Continue to seek public involvement in MS4 / TMDL related projects.
- Continue to explore funding opportunities.
- Conduct annual inspections of installed BMPs included in TMDL Plan.

Permit Term 5 (2027-2032)

- Conduct Stream Enhancement Project on Stream Segment Seven (SS 7)
- Conduct Stream Enhancement Project on Stream Segment Seven (SS 8)
- Conduct annual TMDL Plan evaluations.
- Update TMDL records no less than annually.
- Continue to seek public involvement in MS4 / TMDL related projects.
- Continue to explore funding opportunities.
- Conduct annual inspections of installed BMPs included in TMDL Plan.

**xi. Effectiveness Evaluation**

The effectiveness of the selected BMPs will be evaluated each permit year. The efforts completed to date will be documented and compared to the intent of the MS4 TMDL Strategy. If necessary, the MS4 TMDL Strategy will be revised each year in order to revise the implementation schedule to include reasonable activities and maximize pollutant reductions. The intent of this MS4 TMDL Strategy is to be adaptive, iterative, and dynamic to show measurable progress toward meeting pollutant load reductions.

**4.0 SUMMARY OF FINDINGS**

The information presented in this TMDL Strategy serves as sufficient evidence that West Goshen Township has taken the proper steps to produce an achievable plan of action to meet the 60.87% reduction of sediment, mandated by the “Total Maximum Daily Loads for Bacteria and Sediment in the Christina River Basin, Pennsylvania, Delaware, and Maryland” as established by the United States Environmental Protection Agency, Region III in September 2006.

APPENDIX C

MAPSHED MODELING RESULTS

### Modeled Baseline Sediment Load for West Goshen Township MS4

- Modeled Baseline MS4 Sediment Load = 939,766.1 lb/yr = 469.9 ton/yr
- Required Reduction = (469.9 ton/yr)(60.87%) = 286 ton/yr

Select input data file: C:\Mapshed\Runfiles\BrandywineCreek\_08.13.2015\Output\BrandywineCreek\_Baseline\_08.13.2015-0\_u
